

Uganda RSV Vaccine: Market Entry Scenarios

36-Month Commercial Model | Base vs. Positive Case |
Investment Committee

Uganda represents a significant and underserved RSV opportunity. This deck presents a 36-month bottom-up commercial model across two scenarios — Base and Positive — to frame the investment decision.

~1.75M births/year. Uganda is a real RSV market.

Four regions modelled across public/donor and private channels

Key Market Facts

- National live births:
145,800/month
(1.75M/year)
- Model covers **4 regions**:
Central, Western, Eastern, Northern
- Dual channel:
Public/Donor-funded clinics + Private providers
- ANC access rates range from **58%** (Northern) to **72%** (Central)
- Central region is the largest single opportunity at **28%** of national births

Regional Opportunity & ANC Access

Revenue is a product of 5 conversion steps — each one is a lever.

Central Public channel, Base case, Month 1. Effective reach at launch: ~0.4%.

Each percentage below represents the share of patients who pass through that gate. The funnel starts wide and narrows sharply. The biggest gaps between Base and Positive are at **Eligibility** and **Provider Recommendation** — both are addressable through investment.

What changes between Base and Positive? Execution discipline, not price.

Same regions. Same pricing structure. The difference is access and adoption speed.

The Positive scenario is not a moonshot. It reflects disciplined execution: faster eligibility conversion, better provider engagement, lower rollout churn. Pricing improves only modestly — it is not the driver.

Assumption	Base	Positive	Delta	Commentary
Public Eligibility Rate (start)	28%	35%	+7pp	More funded/affordable access
Eligibility Annual Growth	8%/yr	10%/yr	+2pp/yr	Faster programme expansion
Provider Recommendation Rate (start)	56%	63%	+7pp	KOL and medical engagement
Monthly Coverage Rollout	2.5%	3.4%	+35%	Faster facility onboarding
Monthly Coverage Churn	0.40%	0.30%	-25%	Better execution continuity
Net Price Per Dose	UGX 35,500	UGX 38,340	+8%	Pricing is NOT the primary lever
Landed Vaccine Cost Per Dose	UGX 20,500	UGX 19,475	-5%	Leaner transfer price in Positive

Positive revenue grows 28× over 36 months. Base grows 17×.

Month 1: Base UGX 16M vs Positive UGX 27M. Month 36: Base UGX 273M vs Positive UGX 755M.

Revenue Milestones

Month 1

Base: **UGX 16M**
Positive: **UGX 27M**

Month 12

Base: **UGX 69M**
Positive: **UGX 164M**

Month 36

Base: **UGX 273M**
Positive: **UGX 755M**

Revenue ramp is driven by the coverage state building over time — a dynamic rollout model, not a simple growth assumption. By Year 3, Positive is generating nearly **3× the revenue** of Base on a similar cost structure.

Fixed costs dominate early. Variable costs scale with volume.

Month 1 total costs: Base UGX 130M, Positive UGX 109M. Fixed costs are ~96% of total at launch.

Cost Structure Insights

- Cost base is **predominantly fixed** at launch — regulatory, medical, market access, field reps, office
- Variable costs (vaccine, cold chain, distribution) are modest at low early volumes and grow proportionally
- Positive scenario benefits from **leaner launch and training budgets** — ~16% lower fixed costs than Base
- As volumes scale, variable costs become more significant but gross margins improve

Base M1 Total

UGX 129.8M

Positive M1 Total

UGX 109.4M

Base never breaks even. Positive crosses zero at Month 16.

Positive hits +UGX 2.8M in Month 16. Base is still -UGX 26M/month at Month 36.

Profitability Summary

Both scenarios start deeply loss-making — fixed costs dominate before volume builds.

✔ Positive breaks even at **Month 16** — a milestone Base never reaches in the 36-month plan.

⚠ Base remains loss-making throughout, reaching **-UGX 26M/month** at Month 36.

Month 36 Positive

+UGX 252M/month

Month 36 Base

-UGX 26M/month

Peak cash requirement is similar — the return on that investment is not.

Both scenarios require ~UGX 795M peak investment. Positive recovers fully by Month 28 and reaches +UGX 1,589M by Month 36.

~795M

Peak Burn (UGX)

Nearly identical for both scenarios at Month 15 — the investment ask is the same

4,527M

36-Month Swing (UGX)

Cumulative difference between Base and Positive scenarios over 36 months

M28

Positive Turns Positive

Cumulative cash position turns positive in the Positive scenario at Month 28

-2,938M

Base at Month 36 (UGX)

Base continues to deepen, never recovering within the plan horizon

The Positive case is not aggressive pricing — it's execution.

A UGX 4,527M swing in 36-month cumulative outcome. Driven by access and adoption, not price.

Price improves only **8%** between scenarios — it explains almost none of the gap. The entire swing comes from three execution levers: eligibility, provider engagement, and rollout speed. These are not independent — each requires a specific investment or policy commitment.

Lever	Base → Positive	Delta	Investment Required
Eligibility rate (Central, start)	28% → 35%	+7pp	Donor/govt programme expansion, NHIS coverage
Provider recommendation (Central, start)	56% → 63%	+7pp	KOL engagement, HCP training, medical education
Monthly coverage rollout (Central)	2.5% → 3.4%	+35%	Facility onboarding, awareness campaigns
Coverage churn (monthly)	0.40% → 0.30%	-25%	Supply reliability, execution continuity
Net price per dose	UGX 35,500 → 38,340	+8%	Price is a follower, not a driver

Month 36 Revenue — Base UGX 273M	Month 36 Revenue — Positive UGX 755M (+2.8x)	36-Month Cumulative Swing UGX 4,527M
-------------------------------------	---	---

To reach the Positive trajectory, three things must be true.

Define the go/no-go criteria and investment required to unlock each condition.

1	2	3
Funding access must expand Model lever: Eligibility 28% → 35% Action: Confirm NHIS/donor commitment; define coverage expansion roadmap	Provider engagement must be sustained Model lever: Recommendation rate 56% → 63% Action: Approve KOL programme and HCP training investment	Supply chain must be reliable Model lever: Stock availability 90% → 95% (Central); lower in Northern/Eastern Action: Commit cold-chain and distribution investment, especially Northern and Eastern regions

Financial Milestones

Milestone	Scenario	Timing	Value
Monthly break-even	Positive	Month 16	+UGX 2.8M/month
Cumulative turns positive	Positive	Month 28	+UGX 18.2M cumulative
Month 36 run-rate	Positive	Month 36	+UGX 252M/month
Month 36 cumulative	Positive	Month 36	+UGX 1,589M

 **Call to Action:** What is the cost of the three interventions above — and does that change the model economics? That is the question for this committee.
