

National Drug and Health Products Authority Bill, 2025

Board view of the most material regulatory changes for a large ethical health-products business

Red

Genuinely new — likely to create meaningful cost, process, or market-access pressure

Yellow

Requires adjustment, but manageable and often aligns with existing good practice

Green

Mostly codifies what ethical operators already do — mainly raises pressure on weaker players

This Bill is not just an update to drug regulation: it materially broadens the regulatory perimeter and strengthens enforcement powers. For established companies, the biggest issue is not routine GMP-type compliance — it is the expansion of scope, new hard-stop regulatory controls, and higher operational disruption risk.

Why we have classified the Bill this way

The judgment is about practical newness, not just whether wording is new in law

Red Classification

Provisions where the Bill clearly creates **new legal powers**, extends regulation into previously uncovered product classes, or gives the Authority tools that can directly interrupt operations.

Yellow Classification

Provisions where the Bill requires change, but largely **builds on controls** that mature regulated companies already operate in practice.

Green Classification

Provisions where the Bill mainly **codifies standard ethical-industry behaviour**, especially around quality, documentation, and product integrity.

The Bill itself states that the current law does not adequately cover distribution, pharmacies in health units, lot release, recall and withdrawal, laboratory testing, and seal-off powers. Those are strong indicators of genuine change.

Executive summary of the RAG picture

Most of the board-level risk sits in a relatively small number of Red items

Bottom Line for the Board

The real board issue is the **combination of wider product scope plus stronger regulator intervention powers**. Red items are few but carry disproportionate strategic weight.

- **Red:** Structural changes with outsized impact on market access, compliance burden, and business interruption risk
- **Yellow:** Broader operational uplift — post-market systems, traceability, import-distribution controls
- **Green:** Important, but mainly reinforces expectations already met by large ethical operators

Red Item 1: Expansion of the Regulated Perimeter

The Authority moves beyond drugs into devices, certain cosmetics, public health products, and nutritional supplements

- ⊗ This is the single biggest structural change in the Bill. Businesses active in adjacent portfolios may move from lighter or fragmented oversight into a full registration, licensing, inspection, and enforcement regime.

Strategic Implications

- Product lines previously treated as commercial or consumer-health adjacencies may now need full regulatory ownership
- This can change which parts of the portfolio are strategically attractive
- Heavier compliance overhead now attaches to a wider product set

Cost Implications

- New registrations, notifications, and listings
- New licence applications and renewals
- Additional regulatory staffing and local responsible-person coverage
- Potential portfolio pruning where low-margin lines no longer justify compliance cost

Red Item 2: New Market-Entry Controls Across Newly Regulated Categories

Registration and licensing become a formal gate to manufacture, import, export, distribution, and supply

For newly covered product classes, this creates a much harder legal gate to entering and staying in the market. Even for established companies, this means more structured dossier management, licence dependency, renewal tracking, and exposure to delay. The issue is not only compliance cost — it is **time-to-market and continuity of supply**.

Submission & Fees

Submission and maintenance fees across a wider product portfolio

Dossier Work

Dossier preparation and remediation work for newly regulated categories

Launch Timelines

Longer launch timelines and tied-up working capital during approval periods

Stranded Stock Risk

Higher risk of stranded stock if approvals or renewals slip

Board implication: Market access becomes more regulator-dependent across a wider set of products.

Red Item 3: Explicit Recall, Withdrawal, and Destruction Powers

The Bill gives the Authority clearer legal tools to remove products from the market

The Bill appears to create a much clearer statutory recall and withdrawal regime than the current law. Ethical companies already run recall processes, but this change raises the **legal force, speed, and consequences** of regulator action. The real business issue is execution pressure: traceability, batch visibility, communications, stock segregation, and decision-making must work fast.

Board Implication

Quality events become more likely to turn into **immediate revenue loss, supply disruption, and reputational damage**. Speed of response is now a legal as well as operational requirement.

Cost Implications

- Product retrieval, destruction, replacement, and logistics
- Customer, pharmacy, and provider communication costs
- Increased inventory write-offs
- Heightened brand and tender risk after any visible field action

● Red Item 4: Stronger Inspection and Site-Intervention Powers

Inspectors can seize product, refuse entry, and close or seal premises

- ⊗ This is a major enforcement escalation. The Bill gives the Authority tools that can directly interrupt operations rather than only punish after the fact.

The Core Risk

For good operators, the biggest risk is not deliberate misconduct — it is a serious quality, documentation, or licensing gap discovered at the wrong time. Regulatory non-compliance can now become an **immediate operational shutdown issue**.

Cost Implications

- Halted production or distribution activity
- Delayed imports and stock shortages
- Remediation programmes at site level
- Legal, advisory, and crisis-management spend

Red Item 5: Lot Release for Vaccines, Biologicals, and Diagnostics

Additional release control before products can enter the market

This appears genuinely new and is operationally important for higher-risk biologic and diagnostic categories. It inserts an additional regulatory step into release planning and may affect speed, inventory, and launch timing. For companies in vaccines, biologics, or some diagnostics, this is a real **supply-chain and working-capital issue**.

Longer Batch Release

Extended batch release timelines insert regulatory friction into time-sensitive supply situations

Cold-Chain Burden

Greater forecasting and cold-chain planning burden, especially for tender and outbreak scenarios

Holding Costs

Added holding costs and inventory exposure during the additional regulatory review period

Delivery Risk

Higher risk of missed delivery commitments in tender, outbreak, or time-sensitive supply situations

 **Board implication:** More regulatory friction in release can weaken agility, especially in tender, outbreak, or time-sensitive supply situations.

Red Item 6: Clearer Regulation of Pharmacies in Health Units and Drug Distribution

More formal control of wholesale, retail, and embedded pharmacy operations

The Bill addresses areas the current law reportedly does not adequately cover, especially drug distribution and pharmacies in health units. For hospital groups, private provider networks, and pharmacy-facing businesses, this is a **direct operating model issue**. It also tightens the legal basis for pharmacist accountability and premises licensing in the distribution chain.

Board Implication

Distribution and dispensing channels become more tightly regulated, with **less tolerance for inconsistent entity structures or local workarounds**.

Cost Implications

- Licence remediation across sites and entities
- Pharmacist coverage and supervision costs
- Premises upgrade and inspection-readiness spend
- Possible restructuring of hospital, clinic, and retail pharmacy arrangements

The pressure is operational, financial, and strategic

The pressure is operational, financial, and strategic

More approvals, more inspections, more traceability demands, and greater exposure to hard-stop interventions across a wider product perimeter

Higher ongoing compliance cost, more launch friction, more risk of stock write-offs, and higher cost of remediation when issues arise

Some product lines may become less attractive, while scale, quality maturity, and formal systems become a bigger competitive advantage

Sector effect: This Bill is likely to hurt weaker informal or semi-compliant operators more than large ethical companies — but it still raises the cost base and governance burden for everyone. Scale and quality maturity become a genuine competitive moat.

Board Questions This Bill Should Trigger Now

Decisions needed before the law is finalised and before implementation begins

1

Portfolio Scope

Which current or planned portfolio lines would fall into newly regulated categories?

2

Disruption Exposure

Where do we have the biggest exposure to recall, lot release, or import-stop disruption?

3

Entity Structures

Are our distribution entities, pharmacy-facing arrangements, and site licences structured to withstand tighter inspection?

4

Non-Drug Portfolios

Which non-drug portfolios would need uplift to pharmaceutical-grade regulatory and quality control?

5

Programme Governance

What level of central programme management do we need so implementation is not fragmented across functions?

Bottom Line for the Board

The Bill strengthens the hand of the regulator and raises the cost of operating at scale

The headline issue is not routine compliance codification — it is the combination of **wider regulatory scope** and **sharper intervention powers**.

Who Wins

The companies best placed to win will be those with **disciplined regulatory, quality, and supply-chain systems across the whole portfolio** — not just medicines. Scale and maturity become a genuine competitive moat.

Our Recommendation

Treat this as a **strategic readiness programme**, not a narrow legal review.

- Assess portfolio scope against the new regulatory perimeter
- Stress-test recall, lot release, and import-stop resilience
- Audit entity structures and site licences for inspection-readiness
- Establish central programme governance before implementation begins

✓ Large ethical operators with mature systems are best positioned — but only if they act now, before the law is finalised and implementation pressure begins.
